Markov chains are usually used in modeling many practical problems. They are also effective in modeling time series. In this paper, we apply the Markov chains model to analyze and predict the time series. Some series can be expressed by a first-order discrete-time Markov chain and others must be expressed by a higher-order Markov chain model.

Markov chains are used in ranking of websites in web searches. Markov chains model the probabilities of linking to a list of sites from other sites on that list; a link represents a transition. The Markov chain is analyzed to determine if there is a steady state distribution, or equilibrium, after many transitions.

7 Markov Chains In the zombie apocalypse, a person exists in two states: human or zombie. If a person is a human on any given day, then that person will become a zombie on the next day with probability $1/2$, and if a person is a zombie on any given day, then with a simple application of the moderately successful miracle-cure *ZombieGone* ...

A long, almost forgotten book by Raiffa used Markov chains to show that buying a car that was 2 years old was the most cost effective strategy for personal transportation. Previous to that example, the theory of gambler's ruin frames the problem of a gambler's stake (the amount he will gamble) as the state of a system represented as a Markov chain.

Applications of Finite Markov Chain Models to Management 1

Markov processes are a special class of mathematical models which are often applicable to decision problems. In a Markov process, various states are defined. The probability of going to each of the states depends only on the present state and is independent of how we arrived at that state. Example on Markov Analysis:

Markov chains have many applications as statistical models of real-world processes, such as studying cruise control systems in motor vehicles, queues or lines of customers arriving at an airport, currency exchange rates and animal population dynamics.
