Under such conditions, the distance z_2 is equal to the focal length f . The equation becomes

$$U_2(u) = U_1(\xi) \exp -j u \xi \int_{-\infty}^{\infty} \exp j k u \sqrt{2f - \xi^2} d\xi.$$

(b) For $z_1 \rightarrow \infty$ and $d \rightarrow f$, we have the object illuminated by a normally incident plane wave and situated in the front focal plane. Again $z_2 \rightarrow f$.

Read Book Introduction To Fourier Optics Solution

Fourier optics is the study of classical optics using Fourier transforms, in which the waveform being considered is regarded as made up of a combination, or superposition, of plane waves. It has some parallels to the Huygens–Fresnel principle, in which the wavefront is regarded as being made up of a combination of spherical wavefronts whose sum is the wavefront being studied. A key difference is that Fourier optics considers the plane waves to be natural modes of the propagation medium, as ...
